Loneliness among children with special needs is a groundbreaking volume that examines this vitally important but heretofore neglected topic based on the shared view from both clinical experience and research that children with disabilities experience more loneliness than nondisabled children. This book integrates the existing knowledge, research, and applications in order to provide a model for the examination and understanding of the loneliness experiences of children with learning disabilities, behavior disorders, mild mental retardation, and emotional difficulties. Divided into five sections, the first attempts to clarify the characteristics of the lonely child, followed by a section with chapters devoted to environments and interpersonal relations. The third section is concerned with the subtyping of loneliness and adjustment, and the fourth section discusses the outcomes of loneliness through coping and interventions. The final section provides a summary of the research using the proposed loneliness model for children with disabilities. This volume is essential reading for all researchers, clinicians, educators, and students who work with children with special needs and who, as stated in the preface, see the importance of companionship for promoting growth of children with special needs and the costs of loneliness for current life and future adjustment.

This book could serve either as a good reference to remind students about what they have seen in their completed courses or as a starting point to show what needs more investigation. Svozil, Vienna Univ of Technology, offers a very thorough text that leaves no mathematical area out, but it is best described as giving a synopsis of each application and how it relates to other areas. The text is organized well and provides a good reference list summing up recommended upper division undergraduates and graduate students. This book contains very explicit proofs and demonstrations through examples for a comprehensive introduction to the mathematical methods of theoretical physics. It also combines and unifies many expositions of this subject suitable for readers with interest in experimental and applied physics.

the numerous ways in which man and animals are affected by their physical environment and the inborn and adaptive responses to change in the milieu exterieur have fascinated curious minds since the earliest days of recorded history development of the scientific method with its emphasis on evidence obtained through experimentation perhaps best illustrated in this field by paul bert s encyclopedic work allowed several generations of our predecessors to establish firmly some facts and reject erroneous beliefs but it was only during the early 1940s that environmental physiology put on its seven league boots in 1941 a young physiologist named hermann rahn was recruited by wallace o fenn then chairman of the department of physiology at the university of rochester who was engaged in a study of the effects of altitude on human performance the years that followed witnessed some of hermann rahn s early achievements not only in the area of altitude but in other aspects of environmental physiology as well in particular he participated in the definitive studies of human adaptive mechanisms in arid climates which formed the basis of edward adolph s classic physi ology of man in the desert wiley interscience ny 1947 during those golden years environmental physiology flourished and important dis coveries were reported in a seemingly endless stream from many labora tories
